SECRET/SECURITY INFORMATION

- 2 -

The determination of the octane rating is effected in a special engine, which has a variable compression ratio. For this purpose the engine is at first started on the fuel being tested. Then gradually the compression ratio is increased until knocking occurs. Thereafter, without changing the compression ratio, the operation of the engine is switched over to a fuel composed of hydrocarbons of isocotane and heptane, which is accepted as a standard. Isocotane hardly ever knocks and its octane rating is accepted as 100, while heptane knocks easily and its octane rating is accepted as equal to zero. By adding beptane to isocotane a mixture is formed which gives rise to knocking of the same intensity as the fuel being tested. The number representing the percentage of isocotane in the standard mixture of isocotane and heptane is the octane rating of the fuel being tested. For instance, if a certain fuel being tested knocks at the same compression ratio as a mixture of 60% isocotane and 40% heptane, the octane rating of the fuel will be 60. In the USSR they use as an anti-knock compound, an ethyl fluid consisting of tetraethyl lead (TES), to which are added compounds which will aid in reducing the deposit of lead oxides (ethyl bromide and bromo-ethane) on the parts of the engines. Such gasoline is called ethylated gas. Usually 1/3 cubic centimeter of fluid is added per liter of fuel. The color of ethylated gasoline is usually blue or violet.

B-60 gasoline has an octane rating of 55-60 and is used for engines with a compression ratio of four to five. B-74 gasoline has an octane rating of 74 and is used for engines with a compression ratio of six to seven. B-100 gasoline has an octane rating of 100 and is used for engines with a high compression ratio.

Usually the specific gravity of heavy gasoline grade II is 0.745 and the calculific value is 10,200 kilogram calcules per kilogram.

The specific gravity of cracked gasoline is 0.755 and the calorific value is 10,200 kilogram calories per kilogram.

(b) Ligroin

Ligroin is to some degree heavy gaseline made up of heavy fractions which boil away at temperatures of 150° C to 230° C. It is used chiefly as tractor fuel. The average chemical content is C = 85%, H = 15%.

Specific gravity Calorific value Octane rating 0.755 - 0.790 10,000 kg cal/kg

(c) Kerosene

Kerosene is obtained by distillation of gasoline-ligroin fractions. It is made up of petroleum distillates which boil away at temperatures of 200° to 315° C. The average chemical content is C=86% and H=14%. Two kinds of kerosene, tractor and illuminating, are used in the USSR. Tractor kerosene has a yellowish color while illuminating kerosene is clear with a light bluish tint.

Specific gravity Calorific value Octane rating 0.825 - 0.826 10,200 kg cal/kg 40

(d) Benzene and alcohol are seldom used as fuel in the USSR.

4. There are several different grades of Diesel fuels in use in the Soviet Union.

(a) Gas oil - 9

Specific gravity 0.876
Flash point 70° C
Engler viscosity at 50° C 1.4
Solidification point -20° C
This fuel is used for high speed Diesel engines.

(b) Solar ofl

Specific gravity 0.871 - 0.881 Flash point 130° C
Engler viscosity 1.3 - 1.75
Solidification point -20° C
This fuel is used for high speed Disel engines.

(e) Light motor fuel (Diesel M-1)

Specific gravity 0.851 - 0.896
Flash point 45° C
Engler viscosity 1.1 - 1.2
Solidification point -5° C

This fuel is used for Diesel engines which require light fuels.

SECRET/SECURITY INFORMATION

_ 3 _

(d) Medium motor fuel (Diesel M-2)

(1) Winter grade M-2
Specific gravity 0.875
Flash point 65° C
Engler viscosity 1.2 - 2.
Solidification point .25° C
This fuel is used for Diesels at an outdoor temperature of -17° 0. At lower temperatures tractor kerosene is added in amounts ranging from 15% to 30% of the final mixture.

(2) Summer grade M-2

Specific gravity 0.875

Flash point 65° 65° C

Engler viscosity 1.2 - 3.

Solidification point -10° C

This fuel is used for Diesel engines when the temperature of the air is not lower than 5° C.

(e) Heavy motor fuel

(1) Diesel M-3A
Specific gravity 0.895 - 0.926
Flash point 65° C
Solidification point -5° C
This fuel is used for low speed Diesels.

(2) Diesel M-3B

Specific gravity 0.895 - 0.926

Flash point 90° C

Solidification point 5° C

This fuel is used for low speed Diesels.

(3) Diesel M-3G
This fuel is used for stationary Diesel installations.
